

Max's Magnificent Math: The Shape Station

Step into the Shape Station with Max the Monkey—where every corner is a clue!

- A quadrilateral is a polygon with exactly four sides. Can you spot the four distinct corners, or vertices, on a square or rectangle?
- A line of symmetry is a mirror line where both sides of a shape are identical. If you fold a square in half diagonally, the sides match perfectly!
- An acute angle is smaller than a right angle (less than 90 degrees), while an obtuse angle is larger than a right angle but smaller than a straight line.
- Parallel lines are like railway tracks—they stay the same distance apart and will never meet, no matter how far they go.
- A 3D shape, like a cube or a sphere, has volume and takes up space, whereas a 2D shape is apartment like a piece of paper.

Did you know? Did you know that a hexagon is the shape of a honeycomb cell in Bea the Bee's hive? Bees use hexagons because they are the most efficient shape for storing the most amount of honey using the least amount of wax!
