

Kit's Cyber Safety Guide: Be a Digital Detective!

Stay smart, stay safe, and keep your digital world secure!

- A strong password should be at least 8 characters long and include a mix of uppercase letters, lowercase letters, numbers, and symbols.
- Never share your personal information, such as your home address, school name, or telephone number, with people you do not know online.
- Phishing is when someone tries to trick you into revealing private details by pretending to be someone you trust or a company you know.
- If you see something online that makes you feel worried, sad, or confused, always tell a trusted adult immediately.
- Privacy settings are like the locks on your house; they help you control who can see the things you post and share on the internet.
- Being a good digital citizen means being kind and respectful to others, just as you would be in the classroom or on the playground.

Did you know? Did you know? The first ever computer password was created in the 1960s to stop people from using each other's storage space on a shared computer. Today, strong passwords act like a digital shield for your private data!
