

Finn's Amazing River Journey

Grab your map and splash along with Finn the dolphin as we discover where rivers go!

- **The source is the very start of the river, usually found high up in the hills or mountains.**
- **A river flows downhill because gravity pulls the water towards the sea.**
- **The land along the sides of the river is called the river bank.**
- **Many rivers end their journey when they flow into the wide, salty ocean.**
- **Rivers provide a home for many plants, fish, and birds to live and play.**

Did you know? Did you know? Even the longest, widest rivers all start as tiny trickles of water high up in the hills. As they travel, they join together with other streams to become a big, strong river!
