

Nova's Guide to Amazing Habitats

Explore the wild world with Nova the owl! Can you find where your favourite creatures live?

- A habitat is a natural home where a plant or animal lives and finds the food it needs to grow.
- Animals are well-suited to their homes because they have special features that help them stay safe.
- Forests, oceans, deserts, and ponds are all different types of habitats found on our planet.
- Plants need sunlight, water, and soil to grow, and they are part of a habitat too.
- If a habitat changes, it can be hard for the animals and plants to find what they need to survive.

Did you know? Did you know? Some animals, like the Arctic fox, have thick white fur to help them blend into the snow and stay warm. This is called an adaptation, which helps them survive in their cold habitat!
