

Springtime Science with Nova the Owl

Wake up, nature! Let's explore the wonders of Spring!

- **Spring is the season when the weather starts to get warmer and the days get longer.**
- **Many plants begin to grow from seeds during Spring, a process called germination.**
- **Trees start to grow new green leaves and colorful blossoms in the Spring.**
- **Animals like birds begin to build nests to lay their eggs in the warmer weather.**
- **Bees come out of their hives to find nectar, which helps flowers grow through pollination.**

Did you know? Did you know? In Spring, the Earth's tilt towards the Sun means we get more daylight hours. This extra sunlight helps plants grow faster and wakes up animals from their long winter sleep!
